Section 12 3 Rna And Protein Synthesis Worksheet Answer

Comparing protein signatures—the expression levels of specific arrays of proteins—between samples is an important method for evaluating cellular responses to a multitude of environmental factors and stresses. Analysis of protein signatures can reveal the identity of an organism or how a cell is responding during disease.

Updated September 12, 2019 ... Like rRNA, tRNA is located in the cellular cytoplasm and is involved in protein synthesis. Transfer RNA brings or transfers amino acids to the ribosome that corresponds to each three-nucleotide codon of rRNA. The amino acids then can be joined together and processed to make polypeptides and proteins.

3 Types of RNA: 1)Messenger RNA (mRNA): brings information from the DNA in the nucleus out to the ribosomes; 2)Ribosomal RNA (rRNA): clamp on to the mRNA and use its information to assemble amino acids into a protein; 3)Transfer RNA (tRNA): the "supplier", to the ribosome DNA RNA How does the information in DNA , which is found in the nucleus, get out to the ribosomes in the

12-3 RNA & Protein Synthesis

The antisense strand of DNA is read by RNA polymerase from the 3' end to the 5' end during transcription (3' → 5'). The complementary RNA is created in the opposite direction, in the 5' → 3' direction, matching the sequence of the sense strand. This directionality is because RNA polymerase can only add nucleotides to the 3' end of the growing
