3D Printing and Additive Manufacturing | Mary Ann Liebert

3D printing is a process of building an object one thin layer at a time. It is fundamentally additive rather than subtractive in nature. To many, 3D printing is the singular production of often-ornate objects on a desktop printer. In the early days of 3D printing, the market focused more on consumer intent than industrial value.

Additive Manufacturing vs 3D Printing | GE Additive

The main difference between 3D printing and additive manufacturing is that 3D printing specifically involves the creation of objects by building layers of material. In comparison, additive manufacturing involves the creation of objects by adding material, which may or may not come in layers.

Tesla (TSLA) looks to 'rapidly grow' 3D printing manufacturing

Additive manufacturing, often interchangeably used with the more popular term 3D printing, refers to a range of manufacturing technologies that use additive processes to construct physical objects by adding minuscule layers (hence additive).

Additive manufacturing and 3D printing in manufacturing

Additive manufacturing, also known as 3D printing, is a process used to create a physical (or 3D) object by layering materials one by one based on a digital model. Unlike subtractive manufacturing that creates its final product by cutting away from a block of material, additive manufacture adds parts to form its final product.

As of 2019, the precision, repeatability, and material range of 3D printing has increased to the point that some 3D printing processes are considered viable as an industrial-production technology, whereby the term additive manufacturing can be used synonymously with 3D printing. One of the key advantages of 3D printing is the ability to produce very complex shapes or geometries that would be otherwise impossible to construct by hand, including hollow parts or parts with internal truss ...
