

## 4 7 Inverse Trigonometric Functions Worksheet Day 2 Answers

If you ally dependence such a referred **4 7 inverse trigonometric functions worksheet day 2 answers** books that will offer you worth, acquire the certainly best seller from us currently from several preferred authors. If you want to droll books, lots of novels, tale, jokes, and more fictions collections are furthermore launched, from best seller to one of the most current released.

You may not be perplexed to enjoy all books collections 4 7 inverse trigonometric functions worksheet day 2 answers that we will no question offer. It is not as regards the costs. It's more or less what you habit currently. This 4 7 inverse

### 4 7 Inverse Trigonometric Functions

The graphs of these three inverse trigonometric functions are shown in Figure 4.74.  $y = \tan^{-1} x$ ,  $y = \arccos x$ ,  $y = \cos^{-1} x$ .  $y = \cos^{-1} x$  has an inverse function on this interval.  $y = \cos^{-1} x$ ,  $0 \leq x \leq 1$ , Section 4.7 Inverse Trigonometric Functions 345 You may need to point out to your students that the range for each of these functions is different. Students

## 4.7 Inverse Trigonometric Functions - Dearborn Public Schools

Recall that we write  $\sin^{-1} x$  or  $\arcsin x$  to mean the inverse  $\arcsin$  of  $x$  restricted to have values between  $-\pi/2$  and  $\pi/2$  (Note that  $\sin x$  does not pass the horizontal line test, hence we need to restrict the domain.) We define the other five inverse trigonometric functions similarly.

inverse sine function

$y = \sin^{-1} x$  means

$x = \sin y$ . The inverse sine function is sometimes called the arcsine function, and notated  $\arcsin x$ .

---

## Inverse Trigonometric Functions | Precalculus

The following examples illustrate the inverse trigonometric functions: Since  $\sin(6) = 1/2$ , then  $6 = \sin^{-1}(1/2)$ .

Since  $\cos(\pi/3) = 1/2$ , then  $\pi/3 = \cos^{-1}(1/2)$ .

Since  $\tan(\pi/4) = 1$ , then  $\pi/4 = \tan^{-1}(1)$ .

To create the inverse functions, we choose a restricted domain for each function that includes the number 0.

trigonometric functions exist. The most common convention is to name inverse trigonometric functions using an arc-prefix:  $\arcsin(x)$ ,  $\arccos(x)$ ,  $\arctan(x)$ , etc. (This convention is used throughout this article.) This notation arises from the following geometric relationships: [citation needed] When measuring in radians, an angle of  $\theta$  radians will ...

## Inverse trigonometric functions - Wikipedia

Just as we did with the original trigonometric functions, we can give exact values for the inverse functions when we are using the special angles, specifically  $\frac{\pi}{6}$  ( $30^\circ$ ),  $\frac{\pi}{4}$  ( $45^\circ$ ), and  $\frac{\pi}{3}$  ( $60^\circ$ ), and their reflections into other quadrants.

### 4.7 - Inverse Trigonometric Functions

The inverse trigonometric functions are also called arcus functions or anti trigonometric functions. These are the inverse functions of the trigonometric functions with suitably restricted domains. Specifically, they are the inverse functions of the sine, cosine, tangent, cotangent, secant, and cosecant functions, and are used to obtain an angle from any of the angle's trigonometric ratios.
