Definitions – In this section some of the common definitions and concepts in a differential equations course are introduced including order, linear vs. nonlinear, initial conditions, initial value problem and interval of validity. Direction Fields – In this section we discuss direction fields and how to sketch them. We also investigate how direction fields can be used to determine some information about the solution to a differential equation without actually having the solution.

An elementary course in ordinary differential equations often leaves the impression that only initial value problems are of interest. There are a variety of other possible conditions that are important in applications. For initial value problems, all the conditions are placed at one value of the independent variable—the initial time.
