Herbert Simon made paradigm-changing contributions to the theory of rational behavior, including particularly his treatment of "satisficing" as an alternative to "maximizing" economic rationality . It is therefore worthwhile examining his views of organizations and organizational decision-making and action – especially given how relevant those theories are to my current research interest in organizational dysfunction.

This Handbook brings together a collection of leading international authors to reflect on the influence of central contributions, or classics, that have shaped the development of the field of public policy and administration. The Handbook reflects on a wide range of key contributions to the field, selected on the basis of their international and wider disciplinary impact. Focusing on classics that contributed significantly to the field over the second half of the 20th century, it offers insights into works that have explored aspects of the policy process, of particular features of bureaucracy, and of administrative and policy reforms. Each classic is discussed by a leading international scholar. They offer unique insights into the ways in which individual classics have been received in scholarly

debates and disciplines, how classics have shaped evolving research agendas, and how the individual classics continue to shape contemporary scholarly debates. In doing so, this volume offers a novel approach towards considering the various central contributions to the field. The Handbook offers students of public policy and administration state-of-the-art insights into the enduring impact of key contributions to the field.

Everything you ever wanted to know about growing grapes March and Simon's *Organizations* has become a classic in the field of organizational management for its broad scope and depth of information. Written by two of the most prominent experts in the field, this book offers invaluable insight on all aspects of organizational culture through deep discussion of organization theory. The definitive reference for topics including bounded rationality, satisficing, inducement/contribution balances, attention focus, uncertainty absorption and more, this seminal text offers authoritative insight with a practical grounding in the field.

At the time of its initial publication, *Public Administration* helped to define this field of study and practice by introducing two major new emphases: an orientation toward human behavior and human relations in organizations, and an emphasis on the interaction between administration, politics, and policy. Without neglecting more traditional concerns with organization structure, Simon, Thompson, and Smithburg viewed administration in its behavioral and political contexts. The viewpoints they express still are at the center of public administration's concerns.

Nobel Laureate Herbert A. Simon has in the past quarter century been in the front line of the information-processing revolution; in fact, to a remarkable extent his and his colleagues' contributions have written the history of that revolution in cognitive psychology. Research in this burgeoning new branch of knowledge seeks to describe with precision the workings of the human mind in terms of a small number of basic mechanisms organized into strategies. Newly developed computer languages express theories of mental processes, so that computers can then simulate the predicted human behavior. This book brings together papers dating from the start of Simon's career to the present. Its focus is on modeling the chief components of human cognition and on testing these models experimentally. After considering basic structural elements of the human information-processing system (especially search, selective attention, and storage in memory), Simon builds from these components a system capable of solving problems, inducing rules and concepts, perceiving, and understanding. These essays describe a relatively austere, simple, and unified processing system capable of highly complex and various tasks. They provide strong evidence for an explanation of human thinking in

terms of basic information processes.

What can reason (or more broadly, thinking) do for us and what can't it do? This is the question examined by Herbert A. Simon, who received the 1978 Nobel Prize in Economic Sciences "for his pioneering work on decision-making processes in economic organizations." The ability to apply reason to the choice of actions is supposed to be one of the defining characteristics of our species. In the first two chapters, the author explores the nature and limits of human reason, comparing and evaluating the major theoretical frameworks that have been erected to explain reasoning processes. He also discusses the interaction of thinking and emotion in the choice of our actions. In the third and final chapter, the author applies the theory of bounded rationality to social institutions and human behavior, and points out the problems created by limited attention span human inability to deal with more than one difficult problem at a time. He concludes that we must recognize the limitations on our capabilities for rational choice and pursue goals that, in their tentativeness and flexibility, are compatible with those limits.
