In the United States, some populations suffer from far greater disparities in health than others. Those disparities are caused not only by fundamental differences in health status across segments of the population, but also because of inequities in factors that impact health status, so-called determinants of health. Only part of an individual's health status depends on his or her behavior and choice; community-wide problems like poverty, unemployment, poor education, inadequate housing, poor public transportation, interpersonal violence, and decaying neighborhoods also contribute to health inequities, as well as the historic and ongoing interplay of structures, policies, and norms that shape lives. When these factors are not optimal in a community, it does not mean they are intractable: such inequities can be mitigated by social policies that can shape health in powerful ways. *Communities in Action: Pathways to Health Equity* seeks to delineate the causes of and the solutions to health inequities in the United States. This report focuses on what communities can do to promote health equity, what actions are needed by the many and varied stakeholders that are part of communities or support them, as well as the root causes and structural barriers that need to be overcome.

Das Internet-Ökosystem ist gekennzeichnet durch eine starke Dynamik und ausgeprägte Evolutorik. Während sich das Spektrum an Inhalten und Anwendungsdiensten, welche integriert über "General-Purpose"-Breitbandnetze bereitgestellt werden sollen, fortwährend wandelt, werden sowohl die Anforderungen an die Datenübermittlung als auch entsprechende Kapazitätsallokationsprobleme zunehmend komplexer. Die erwartete Rolle des Internets der Dinge, 5G oder Virtual-Reality-Anwendungen unterstreicht, wie wichtig es für Anbieter von breitbandigen Zugangsdiensten sein wird, diesen sich wandelnden Anforderungen in einer ökonomisch effizienten Weise gerecht werden zu können. Dieses Buch untersucht Evolution und den Wettbewerb im Internet-Ökosystem und führt eine netzökonomische Analyse effizienter Kapazitätsallokationen in All-IP-Netzen durch. In diesem Zusammenhang wird die Rolle von Netzneutralitätsregulierungen kritisch bewertet.

The use of modern planning and optimization systems for process synchronization in value networks requires the optimal information exchange between the entities involved. The central focus of Sven Grolik's study is the development of efficient mechanisms for the coordination of information allocation by the example of interconnected transportation marketplaces. Unlike traditional information allocation algorithms, the algorithms developed in his analysis are based on update mechanisms which maintain a weak consistency of replicated information in the network. Sven Grolik shows that these algorithms enable savings concerning the update costs as well as increase the performance within the network, but at the same time guarantee compliance with quality of service levels concerning the currency of information. The focus of this work is the development of decentralized, online algorithms which make a logically distributed computation possible on the basis of local information. The development of these innovative algorithms is based on approaches of multi-agent system theory as well as distributed simulated annealing techniques.

This book develops allocation mechanisms that aim to ensure an efficient resource allocation in modern IT-services. Recent methods of artificial intelligence, such as neural networks and reinforcement learning, and nature-oriented optimization methods, such as genetic algorithms and simulated annealing, are advanced and applied to allocation processes in distributed IT-infrastructure, or grid systems.

For many years now Enterprise Information Systems have been critical in helping businesses successfully navigate the global market. The development that started with design and implementation of integrated systems has evolved to incorporate a multitude of perspectives and ideas. The Enterprise Information Systems functionality extends from principally an ERP (Enterprise Resource Planning) system to a portfolio of standard systems including CRM (Customer Relationship Management) systems and SCM (Supply Chain Management) systems. *Advances in Enterprise Information Systems II* is divided into seven thematic sections, each exploring a distinct topic. In "Concepts in Enterprise Information Systems" the authors present new concepts and ideas for the field. "Cases in Enterprise Information Systems" introduces studies of enterprise information systems in an organizational context. "Business Process Management" is one of the major themes within enterprise information systems and "Designing Enterprise Information Systems" discusses new approaches to the design of processes and system and also deals with how design can be taken as a specific perspective. "Enterprise Information Systems in various domains" features generic studies that contribute to advancing the practical knowledge of the field as well as towards "Global issues of Enterprise Information Systems". Finally, in "Emerging Topics in Enterprise Information Systems", new technologies and ideas are explored. Cloud computing in particular seems to be setting the agenda for future research in enterprise information systems. The book will be invaluable to academics and professionals interested in recent developments in the field of enterprise information systems.

The competition for limited health care resources is intensifying. We urgently need an acceptable method for deciding how they should be allocated. But the goods that health care produces are of very different kinds. Health care can extend the lives of children and of older people. It can make it possible for a person to walk, when without health care that person would be permanently bedridden; and it can reduce the pain and distress of people who are terminally ill. How can we possibly decide which of these - and many more - diverse achievements of health care are more deserving than others? We need a common unit by which we might be able to measure these very different goods. The Quality-Adjusted Life Year, or QALY, is the most developed proposal for such

a unit of measure. In this book a distinguished team of ethicists and economists defend the core of the QALY proposal: that health care resources should be used so as to produce more years of life, of the highest possible quality. This leads to a discussion of such fundamental questions as whether all lives are of equal value, whether health care should be allocated on the basis of need and whether the QALY approach incorporates an adequate account of fairness or justice. The result is the most thorough account yet of the ethical issues raised by the use of the QALY as a basis for allocating health care resources.
