The medication used to induce anesthesia is called an anesthetic. The main types of anesthesia include: Procedural sedation: Commonly used outside of an operating room setting, procedural sedation provides a depressed level of consciousness so that a patient can tolerate unpleasant procedures without affecting cardiovascular function and without the need for airway management (help with breathing)

What are General anesthetics? General anesthetics are medicines that render a patient reversibly unconscious and unresponsive in order to allow surgeons to operate on that patient. General anesthetics are normally administered intravenously or by inhalation by a specialist doctor called an anesthetist who also monitors the patient's vital signs (breathing, heart rate, blood pressure, temperature) during the procedure.
