System-on-Chip Design - ARM

Steve Furber has a long association with the ARM, having helped create the first ARM chips during the 1980s. Now an academic, but still actively involved in ARM development, he presents an authoritative perspective on the many complex factors that influence the design of a modern system-on-chip and the microprocessor core that is at its heart.

The ARM Advanced Microcontroller Bus Architecture (AMBA) is an open-standard, on-chip interconnect specification for the connection and management of functional blocks in system-on-a-chip (SoC) designs. It facilitates development of multi-processor designs with large numbers of controllers and components with a bus architecture.Since its inception, the scope of AMBA has, despite its name, gone ...

Advanced Microcontroller Bus Architecture - Wikipedia

Arm architecture ensures better security, wide compatibility, high performance, and energy efficiency. Our central processor unit (CPU) architecture comes in three varieties optimized for different use cases: A-Profile for rich applications, R-Profile for Real-time, and M-Profile for microcontrollers. CPU Architecture defines what a CPU must do when software runs on it.

CPU Architecture – Arm

ARM (stylized in lowercase as arm, previously an acronym for Advanced RISC Machine and originally Acorn RISC Machine) is a family of reduced instruction set computing (RISC) architectures for computer processors, configured for various environments.

ARM architecture - Wikipedia

ARM System-on-Chip Architecture introduces the concepts and methodologies employed in designing a system-on-chip based around a microprocessor core, and in designing the core itself. Extensive illustrations, based on the ARM, give practical substance to the design principles set out in the book, reinforcing the reader's understanding of how and why SoCs and microprocessors are designed as they are.
