$Q = V \cdot A$ . Where Q = Volumetric Flow Rate, ft<sup>3</sup>/min V = Air Velocity, ft/min or fpm A = Cross Sectional Area, ft<sup>2</sup> or SF. 1 velocity = 50 FPM. Air Flow Hood velocity = 3000 fpm Duct Flow rate at point 1 is called Q. 1. and is equal to flow rate at point 2 which is called Q. 2. Conservation of Mass.

Ventilation Performance. Building ventilation involves three essential elements: Ventilation Rate; The ventilation rate deals with the quality and amount of outdoor air that is being ventilated into a particular space. Buildings need to adhere to ventilation rate standards, which usually vary for residential and commercial buildings.

Basic Principles of Ventilator Design The Ventilator as a “Black Box” A mechanical ventilator is an automatic machine designed to provide all or part of the work the body must do to move gas into and out of the lungs. The act of moving air into and out of the lungs is called breathing, or, more formally, ventilation.

Mechanical Ventilation: Respiratory failure is caused by failure to oxygenate (Type I respiratory failure), with resultant decrease in PO<sub>2</sub> or failure to ventilate (Type II respiratory failure), with a resultant increase in PCO<sub>2</sub>. Breathing Pattern consists of a Control variable, Breath sequence and a targeting scheme.

Mechanical Ventilation is a modality commonly used in the critically ill, but many providers, may not have a strong understanding of the basics. Emergency Medicine and Critical Care Physicians need to have a firm grasp of the basic concepts of mechanical ventilation because without it, we can do serious harm to our patients.

They are named as “Special modes of Ventilation”. 1. Synchronised Intermittent Mandatory Ventilation: SIMV 2. Biphasic Positive Airway Pressure: BIPAP 3. Airway Pressure Release Ventilation: APRV 4. Minimum Mandatory Volume: MMV. AVAILABLE MODES There are two basic categories of modes: Controlled or Assisted. Controlled Ventilation

### **Basic of Mechanical Ventilation - Mechanical Ventilation Modes**

In a ventilation system based on the piston principle the supply air moves through the rooms like a "piston". The piston principle can be regarded as an extreme variant of the displacement system with a minimum of turbulence in the air flow passing through the room. used in special applications - like clean rooms, operating theaters etc.
