That is, $y = C_1 e^{5x} + C_2 e^{-5x} + \frac{1}{5} a b x - \frac{1}{5} C > \frac{1}{5} P$. The general solution of the differential equation is $y = C_1 e^{5x} + C_2 e^{-5x} + \frac{1}{5} a b x - \frac{1}{5} C$. This is exactly the form given by Eq. in the text. Invoking an initial condition $y(0) = a b a b$ ($C_1 + C_2 = C$) the solution may also be expressed as $C_1 = \frac{1}{2} (C + \frac{1}{5} a b a b)$ and $C_2 = \frac{1}{2} (C - \frac{1}{5} a b a b)$.

Boyce's Elementary Differential Equations and Boundary Value Problems, like its predecessors, is written from the viewpoint of the applied mathematician, whose interest in differential equations may sometimes be quite theoretical, sometimes intensely practical, and often somewhere in between. The authors have sought to combine a sound and accurate (but not abstract) exposition of the elementary theory of differential equations with considerable material on methods of solution, analysis, and ...
