The Canon EOS M was released in June 2012 with a mirror-less interchangeable lens following the trend by Panasonic makers four years before. It is compact and easy to use but is capable of producing great pictures with its 18 megapixels, at a low price and is perfect for persons who are new to digital cameras. It is said to be a smaller version of the previously released Canon EOS 650D but with a much simpler interface as is seen with the lack of a viewfinder, some buttons and dials that were present in earlier models. It has a detailed CMOS sensor and is very precise with high speed.

Increasing numbers of ecologists and conservation biologists have begun to explore the use of drone technology to obtain accurate and up-to-date data on the distribution and density of species, as well as the threats to their habitats, in their ongoing attempts to conserve and monitor biodiversity. Conservation drones are low-cost, autonomous, and operator-friendly unmanned aerial vehicles that can be used for surveying, mapping, and monitoring both habitat and biodiversity. They are fast becoming a valuable complement to ground-based surveys and satellite imagery for a wide range of ecological and conservation applications. The authors pioneered the use of conservation drones for the purpose of monitoring orangutan populations in Southeast Asia. They subsequently founded ConservationDrones.org to share their knowledge of building and using drones with colleagues in the wider environmental community. This website has proved highly popular and this book aims to further build capacity to use drones and inspire others to adapt emerging technologies for practical conservation.
