The modeling of minerals and silicated materials is a difficult challenge faced by Solid State Physics, Quantum Chemistry and Molecular Dynamics communities. The difficulty of such a modeling is due to the wide diversity of elements, including heavy atoms, and types of bonding involved in such systems. Moreover, one has to consider infinite systems: either perfect crystals or glasses and melts. In the solid state a given chemical composition gives rise to numerous polymorphs, geometrically closely related. These polymorphs have very similar energies and related thermodynamical properties which explain the complexity of their phase

diagrams. The modeling of silicates and minerals covers a wide field of applications ranging from basic research to technology, from Solid State Physics to Earth and Planetary science. The use of modeling techniques yields information of different nature. In the case of chemical studies, we can mention investigations on catalytic processes occurring on surfaces and in zeolite cages. These calculations find possible applications in chemical engineering, in particular in the oil industry.
