Section 8.2 - The Nature of Covalent Bonding. In ionic bonding, atoms transfer electrons to achieve noble gas configuration. In covalent bonding, atoms share electrons to achieve noble gas configuration. Most atoms share electrons until they have a total of 8 valence electrons (octet rule).

Chapter 8 - Covalent Bonding

242 Chapter 8 • Covalent Bonding Single Covalent Bonds When only one pair of electrons is shared, such as in a hydrogen molecule, it is a single covalent bond. The shared electron pair is often referred to as the bonding pair. For a hydrogen molecule, shown in Figure 8.4, each covalently bonded atom equally attracts the pair of shared electrons.

Chapter 8: Covalent Bonding. Matter takes many forms in nature: In this chapter, we are going to learn to distinguish the type of compound that we have already studied, the "ionic compound" (which contains oppositely-charged particles: metal cations and non-metal anions), from a different type of compound - a "molecular compound".

Chapter 8: Covalent Bonding

Chapter 8 Covalent Bonding and Molecular Structure 8-11. nuclei. This results in stronger attractive forces between electrons and nuclei, decreasing the distance between the nuclei. A carbon-carbon single bond has a bond order of 1 and is longer than a carbon-carbon double bond with a bond order of 2.

Chapter 8: Covalent Bonding and Molecular Structure

Covalent bonding. The atoms form a covalent bond by sharing their valence electrons to get a stable octet of electrons.(filled valence shell of 8 electrons) There are two electrons per bond, each atom donates one electron to the bond. Electron-Dot Diagrams of the atoms are combined to show the covalent bonds. Covalently bonded atoms form MOLECULES
