Charles Darwin ' s theory of evolution by natural selection is the foundation upon which modern evolutionary theory is built. The theory was outlined in Darwin ' s seminal work On the Origin of Species, published in 1859. Although Victorian England (and the rest of the world) was slow to embrace natural selection as the mechanism that drives evolution, the concept of evolution itself gained widespread traction by the end of Darwin ' s life.

The Origin of Species (the full title being, 'On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life'), is a scientific work by Charles Darwin, published on 24 November 1859. It is considered to be the foundation of evolutionary biology, introducing the scientific theory that populations evolve over the course of generations through a process of natural selection. The book includes evidence that Darwin had collected on the Beagle expedition in the 1830s and his subsequent findings.

This book is an accessible guide to the theory of evolution. It lets the young reader discover how Darwin changed our understanding of the human race and our place within the animal kingdom.

States the evidence for a theory of evolution, explains how evolution takes place, and discusses instinct, hybridism, fossils, distribution, and classification.

An original, unpublished manuscript written before the Origin of Species which contains the references to journal articles and books that Darwin used in formulating his controversial ideas. This volume has been edited and annotated and includes a cross-indexing to the Origin.

This volume marks a new approach to a seminal work of the new modern scientific imagination. Darwin's central theory of natural selection neither originated nor could be contained within the natural sciences, but continues to shape and challenge our most basic assumptions about human social and political life. Seven readings, crossing the fields of history, literature, sociology, anthropology and the history of science, demonstrate the complex position of the text within the cultural debates past and present.

This collection features five essays from noted theologians, philosophers, geneticists, and biologists who discuss the sweeping impact of Charles Darwin's On the Origin of Species on their respective fields. This volume, edited by Ralph Buchsbaum, professor of biology at the University of Pittsburgh, was published to celebrate the centenary of Darwin's announcement in 1858, along with Alfred Russel Wallace, of their independent discovery of the process of natural selection. Darwin's book was published one year later.
