Solutions to the problems in Circuit Theory 1. We have the circuit on
the right, with a driving voltage $U_S = 5 \text{ V}$, and we want to know U and
 I . a. $R = 1000 \text{ } \Omega$; the total resistance in the circuit is then $R_{\text{tot}} =$
 $1010 \text{ } \Omega$, and we can use Ohm's law to find $I = U_S / R_{\text{tot}} = 5 / 1010 \text{ A} =$
 4.95 mA and $U = RI = 4.95 \text{ V}$. b.

Solutions to the problems in Circuit Theory

Both AC and DC circuits can be solved and simplified by using these
simple laws which is known as Kirchhoff's Current Law (KCL) and
Kirchhoff's Voltage Law (KVL). Also note that KCL is derived from the
charge continuity equation in electromagnetism while KVL is derived
from Maxwell - Faraday equation for static magnetic field (the
derivative of B with respect to time is 0)

Solution: As the link resistance between the terminals a-b is zero, hence, the link is practically a short circuiting link and the current through the link is assumed to be $I_{s.c}$. Let us now first take the 50V source. The circuit configuration for this case is shown in figure 5.

Question 5 While studying DC circuit theory, you learned that resistance was an expression of a component's opposition to electric current. Then, when studying AC circuit theory, you learned that reactance was another type of opposition to current. Now, a third term is introduced: impedance. Like resistance and reactance, impedance is also a form of opposition to electric current.
