The code is built on RCAN(pytorch) and tested on Ubuntu 16.04 (Pytorch 0.4.0) Main Contents 1. Introduction. Abstract: Recently, deep convolutional neural networks (CNNs) have been widely explored in single image super-resolution (SISR) and obtained remarkable performance. However, most of the existing CNN-based SISR methods mainly focus on wider or deeper architecture design, neglecting to explore the feature correlations of intermediate layers, hence hindering the representational power of ...

In this example, Rectangle is the superclass, and Square is the subclass. Because the Square and Rectangle.__init__() methods are so similar, you can simply call the superclass's .__init__() method (Rectangle.__init__()) from that of Square by using super(). This sets the .length and .width attributes even though you just had to supply a single length parameter to the Square constructor.
