# Access PDF Comparison Of Radio Direction Finding

Radio Direction Finding works by comparing the signal strength of a directional antenna pointing in different directions. At first, this system was used by land and marine-based radio operators, using a simple rotatable loop antenna linked to a degree indicator.

determine the direction of the signal.

These come in two types, "homing" DF units which tell you which way (left or right) you need to rotate the antenna to be pointing directly at the transmitter, and doppler DF units which constantly tell you which direction the signal is in, regardless of which direction the receiver is pointing.
