Survey sampling is fundamentally an applied field. The goal in this book is to put an array of tools at the fingertips of practitioners by explaining approaches long used by survey statisticians, illustrating how existing software can be used to solve survey problems, and developing some specialized software where needed. This book serves at least three audiences: (1) Students seeking a more in-depth understanding of applied sampling either through a second semester-long course or by way of a supplementary reference; (2) Survey statisticians searching for practical guidance on how to apply concepts learned in theoretical or applied sampling courses; and (3) Social scientists and other survey practitioners who desire insight into the statistical thinking and steps taken to design, select, and weight random survey samples. Several survey data sets are used to illustrate how to design samples, to make estimates from complex surveys for use in optimizing the sample allocation, and to calculate weights. Realistic survey projects are used to demonstrate the challenges and provide a context for the solutions. The book covers several topics that either are not included or are dealt with in a limited way in other texts. These areas include: sample size computations for multistage designs; power calculations related to surveys; mathematical programming for sample allocation in a multi-criteria optimization setting; nuts and bolts of area probability sampling; multiphase designs; quality control of survey operations; and statistical software for survey sampling and estimation. An associated R package, PracTools, contains a number of specialized functions for sample size and other calculations. The data sets used in the book are also available in PracTools, so that the reader may replicate the examples or perform further analyses.

Don't let your creative ideas get picked apart and put down! If you're like most creative people, chances are high that you've had your share of ideas rejected by clients or decision makers. While we sometimes make the mistake of believing ideas should sell themselves, the fact is that the better and bolder the idea, the more it needs selling. This book contains powerful techniques to help you sell your ideas to those with approval power. You'll find tips from designers, writers, marketers and other creative professionals, along with meaty advice from selling and branding gurus. In no time, you'll be able to convince those who hold the purse strings that your ideas are worth pursuing and investing in. "Designers have a little known secret: Designing something is the easy part, getting others, specifically clients, to embrace that design is the real hard part. Harrison has put together dozens of tips that, if applied correctly, independently or in unison, will help you get those great design ideas approved." —Armin Vit and Bryony Gomez-Palacio, authors of Graphic Design, Referenced

This book aims to provide an overview of some adaptive techniques used in estimating parameters for finite populations where the sampling at any stage depends on the sampling information obtained to date. The sample adapts to new information as it comes in. These methods are especially used for sparse and clustered populations. Written by two acknowledged experts in the field of adaptive

sampling.
