The will result in the overall volume of air displaced by the engine. For example if we have a bore of 4 inches and a stroke length of 3.52 inches on an 8 cylinder engine, the displacement would be: Displacement = (4 in./2) x (4 in./2) x 3.1416 x 3.52 in. x 8 = 353.86 cubic inches.

Bore = $\sqrt{[\text{displacement} \div (0.7854 \times \text{stroke} \times \text{number of cylinders})]}$ In the case of a 305 Chevy, the stroke is 3.48 inches, the same as a 350. By plugging in the known variables, you calculate the unknown bore dimension as follows. Bore = $\sqrt{[305 \div (0.7854 \times 3.48 \times 8)]}$ = 3.734 inches bore diameter Calculator sequence:

Displacement is used to calculate the compression ratio of an engine and is used to indicate the size of an engine. The formula to find engine displacement is: displacement = $\pi \times b^2 \times s \times c$. Where b is equal to the bore size, s is equal to the stroke length, and c is the number of cylinders.
