**Engine Ftb**

The Force Engine is an engine producing MJ using Liquid Force as a fuel source, although certain other liquid fuels can be used as well. It also uses power output multipliers (throttle) and will not explode when overheating.

**Engine - Feed The Beast Wiki**
Engines are machines used to generate energy in the form of MJ. While originally added by Buildcraft, engines are now available from a variety of mods. Depending on the type, engines require different types of fuel or materials to run. What they all have in common however is that they need a redstone signal (e.g. from a Lever) to work, unless configured otherwise. Any of these machines can be ...

Note: Lava is no longer usable as a source of fuel. The Combustion Engine filled with lava as fuel and water as the coolant
One Combustion Engine ...

**Combustion Engine - Official Feed The Beast Wiki**

The Electrical Engine is a Forestry engine that converts 6 EU/t into 20 RF/t, accepting any voltage (LV, MV, HV or EV). The Electrical Engine has 4 different upgrades that can be applied to it using a Soldering Iron.

**Electrical Engine - Official Feed The Beast Wiki**

Stirling engines (formerly incorrectly named steam engines) are the second tier of Engines. They use cobblestone instead of wood or iron so are still cheaper than the Combustion Engine. These engines cannot explode unless there is an oversupply of power.

**Stirling Engine - Feed The Beast Wiki**

The Redstone Engine is the most basic and cheapest type of BuildCraft engine. To run, all that Redstone Engines require is a direct Redstone signal (e.g. from levers), but they also provide the least amount of power (1MJ/s or 0.05MJ/t), they cannot connect to Kinesis Pipes, but as of a recent BuildCraft update they can be daisy chained with other Redstone Engine.

**Redstone Engine - Feed The Beast Wiki**

The peat-fired engine is fuelled with Peat or Bituminous Peat. Peat provides 10 RF per tick for 5000 ticks, and produces Ash at a rate of 0.66 ash per peat. Bituminous Peat produces 20 RF per tick for 6000 ticks, and produces ash at a rate of 0.66 ash per peat. Fuel can be pumped into the sides of the engine.

**Peat-fired Engine - Official Feed The Beast Wiki**

The Thermal Engine is the first tier of thermal engine modules in Steve's Carts. It's less efficient with Lava than the Advanced Thermal Engine, but it doesn't require a coolant (Water). To supply Lava, the cart needs a tank module.

**Thermal Engine - Official Feed The Beast Wiki**

Hobbyist's Steam Engine
The Hobbyist's Steam engine is a stand-alone engine, capable of running on its own so long as you supply it with enough fuel and water. The water inside will boil once the temperature of the engine is at or exceeds 100 degrees Celsius, like boiling water in real life.

**Hobbyist's Steam Engine - Feed The Beast Wiki**

The Stirling Engine, formerly called the Steam Engine, is the second tier of engine in BuildCraft and provides 10 Redstone Flux per tick (RF/t).

Because FTB included tech mods, it was possible to use the various custom blocks and items to keep track of the challenges and the player's progress, as well as automatically give awards after each challenge was met. The map was then adapted to allow multiple players to compete against each other in a race to complete the objectives.

**Feed the Beast**

The Biogas Engine is an engine added by the Forestry mod. It can generate MJ from several different liquids, outputting different amounts of power depending on what it's fueled with. Like any other BuildCraft engine, Biogas Engines need to be activated by a Redstone current. However, unlike other engines Biogas Engines also require a minimum operating temperature to run.

**Biogas Engine - Feed The Beast Wiki**

Combustion Engines are the third tier of engine, and the most powerful in BuildCraft itself, although some engines in other mods (for example Railcraft's Industrial Steam Engine) surpass them. They are crafted from iron, making them the most expensive of the BuildCraft engines. Combustion engines draw full stacks when used on a Wooden Pipe. They are designed to power machines that require a ...

The Refinery is a BuildCraftblock that converts Oil into Fuel at a 1:1 ratio or Biomass into Biofuel at a 4:1 ratio. Oil and Biomass can be pumped into the Refinery usingWaterproof Pipes, or dumped inside by right-clicking on the refinery with a bucket filled with Oil or Biomass. Fuel and Biofuel can then be pumped out via Waterproof Pipes once the conversion is complete. Fuel is more powerful ...
