Engineering Dynamics Dynamics is a branch of mechanics that studies the analysis of forces and torques and their effect on motion on bodies and systems. To put this in simpler terms, dynamics is the study of particles in motion. The most important equation in engineering dynamics is the sum of the forces equal mass times acceleration.

Specialists in Vibration, Pulsation and Machinery. Engineering Dynamics Incorporated (EDI) is an engineering consulting firm providing solutions to vibration problems for a wide range of industries world wide. Vibration is a major cause of machine and plant downtime, as well as a safety concern. Analytical studies, modeling, field measurements and experience are the tools that EDI uses to provide vibration and pulsation solutions.

Rotational dynamics pertains to objects that are rotating or moving in a curved path and involves such quantities as torque, moment of inertia/rotational inertia, angular displacement (in radians or less often, degrees), angular velocity (radians per unit time), angular acceleration (radians per unit of time squared) and angular momentum (moment of inertia times unit of angular velocity). Very often, objects exhibit linear and rotational motion.
