In recent years, the question of war and sacrifice has been a major topic of political debate and controversy. If our country goes to war for reasons we endorse, what is our responsibility to share in its sacrifices? Does supporting a war mean serving in it? Does it mean encouraging our children to do so? Such questions have been posed by the so-called "chickenhawk" phenomenon: pro-war leaders and their pro-war children who call on Americans to assume the burden of war and its sacrifices, but avoid those sacrifices themselves. President Bush and other architects of the Iraq conflict were the most prominent chickenhawks. Cheyney C. Ryan argues that the chickenhawk issue is not just a matter of personalities—it will remain with us for a long time even though the Bush administration has left office. Ryan poses fundamental questions of war and personal sacrifice, pointing to the basic disconnection in American politics generally between the support for war and the willingness to assume its costs, which he calls "Alienated War." Calling for the reinvigoration of civic involvement, this illuminating and insightful book offers both a philosophical and historical exploration of America's citizen-soldier tradition and the consequences involved in separating the citizenry from the armed forces.

Stroke is a major cause of death and the major cause of adult neurological disability in most of the world. Despite its importance on a population basis, research into the genetics of stroke has lagged behind that of many other disorders. However, the situation is now changing. An increasing number of single gene disorders causing stroke are being described, and there is growing evidence that polygenic factors are important in the risk of apparently "sporadic" stroke. Stroke Genetics provides an up-to-date review of the area, suitable for clinicians treating stroke patients, and both clinical and non-clinical researchers in the field of cerebrovascular disease. The full range of monogenic stroke disorders causing cerebrovascular disease, including ischaemic stroke, intracerebral haemorrhage, aneurysms and arteriovenous malformations, are covered. For each, clinical features, diagnosis, and genetics are described. Increasing evidence suggest that genetic factors are also important for the much more common multifactorial stroke; this evidence is reviewed along with the results of genetic studies in this area. Optimal and novel strategies for investigating multifactorial stroke, including the use of intermediate phenotypes such as intima-media thickness and MRI detected small vessel disease are reviewed. The book concludes by describing a practical approach to investigating patients with stroke for underlying genetic disorders. Also included is a list of useful websites.
