Solution We use Euler's formula: $V + F = E + 2$. (a) There are $E = V + F - 2 = 6$ edges. Here is an example:

(Note that the outer face is also counted!) (b) There should be $V = E - F + 2 = 4$ vertices. However, this is not possible without creating duplicate edges.

With duplicate edges, it is possible, and the formula gives the

Ex 5.4.3 A regular graph is one in which the degree of every vertex is the same. Show that if G is a regular bipartite graph, and the common degree of the vertices is at least 1, then the two parts are the same size. Ex 5.4.4 A perfect matching is one in which all vertices of the graph are incident with an edge in the matching. Show that a regular bipartite graph with common degree at least 1 has a perfect matching.

Selected Solutions to Graph Theory, 3rd Edition

Graph theory studies combinatorial objects called graphs.

These objects are a good model for many problems in mathematics, computer science, and engineering. Graph theory is not really a theory, but a collection of problems.

Many of those problems have important practical applications and present intriguing intellectual challenges.
