In terms of hydrodynamic regime, two significantly different hydrodynamic conditions were revealed in response to differences in the incident wave energy. Under low wave energy the tidal currents are dominant; however, flow reversal appears under higher energy conditions (Pope, 1997).

Hydrodynamics Hydrodynamics is a common application of CFD and a natural extension of Dynamiq's core aerodynamic expertise. CFD allows the steady-state and transient hydrodynamics of hydrofoils, submersible vehicles, propellers, impellers, marine structures and marine plant to be computed with extremely high levels of accuracy.

Hydrodynamic bearings function by the surface tension of the lubricant on the rotating journal producing shear (force) across the lubricant/ oil film thickness within the convergent geometry of the journal and bearing, with the shear in-turn generating pressure resulting in the shaft (load) being supported over an arc of (varying) distributed pressure, Figure 3.

Hydrodynamic Lubrication or Thick Film Lubrication Hydrodynamic lubrication is said to exist when the moving surfaces are separated by the pressure of a continuous unbroken film or layer of lubrication. In this type of lubrication, the load is taken completely by the oil film. The basis of hydrodynamic lubrication is the formation of an oil wedge.

Hydrodynamic devices use convection to enhance the rate of mass transport to the electrode and can offer advantages over techniques which operate in stagnant solution. The addition of convection to the cell usually results in increased current and sensitivity in comparison to voltammetric measurements performed in stagnant solution.

Hydrodynamic journal bearing is a bearing operating with hydrodynamic lubrication, in which the bearing surface is separated from the journal surface by the lubricant film generated by the journal rotation. Most of engine bearings are hydrodynamic journal bearings.
