reaction or standard enthalpy of a reaction, and like ΔH also measures the enthalpy of a reaction. However, $\Delta H^\circ_{\text{rxn}}$ takes place under "standard" conditions, meaning that the reaction takes place at 25°C and 1 atm. The benefit of a measuring ΔH under standard conditions lies in the ability to relate one value of ΔH° to another, since

Thermochemistry Lab #2 - Heat of Reaction - Hess's Law Return. The foundation of the study of thermochemistry was laid by the chemist Germain Hess, who investigated heat in chemical reactions during the last century. One statement of the law that bears Hess's name says: The enthalpy change for any reaction depends on the products and

Calculate the heat liberated per mole of water produced, H_{neut} : H_{neut} will be negative because the reaction is exothermic

H_{neut} = heat liberated per mole of water
 $= -1 \times q \div \text{moles of water}$ $H_{neut} = -1 \times 1.255 \text{ kJ} \div 0.025 \text{ mol} = -50.2 \text{ kJ/mol}$ Thus,

$H_2 = -50.2 \text{ kJ/mol}$ Part C: Heat of NaOH solution (Solid NaOH + HCl solution) 1.
