Stomata is the minute openings, generally found in the epidermis of leaves. They are typically found in the leaves and can also be found in stems and other plant organs. It plays an important role by permitting the movement of gases such as oxygen, carbon dioxide, and water vapour to diffuse between the interior and outer surface of the plant tissues.

Following this, the students outline how they could use the infrared thermometer to investigate differences in the stomatal density in the upper and lower epidermis of leaves. This exercise is a good opportunity for stretch and challenge as some students will need a lot of help to realise that this can be achieved by comparing the effect on leaf surface temperature of applying petroleum jelly to the lower epidermis (where there are lots of stomata) with the effect of applying petroleum jelly ...

The surface structure of a leaf is observed using increasingly larger magnifications. We can see the detail of stomata. The absorption of carbon dioxide through stomata is discussed and linked to the structural features of a tree. The idea of stomata and their density on the leaf surface is often a difficult one to relay to students.
