This book provides an update on recent advances in various areas of modern engineering design, such as mechanical, materials, computer, and process engineering, which provide the foundation for the development of improved structures, materials, and processes. The modern design cycle is characterized by the interaction of different disciplines and a strong shift toward computer-based approaches involving only a small number of experiments for verification purposes. A major driver for this development is the increased demand for cost reduction, which is also connected to environmental demands. In the transportation industry (e.g. automotive or aerospace), where there is a demand for greater fuel efficiency, one solution is lighter structures and/or improved processes for energy conversion. Another emerging area is the interaction of classical engineering with the health and medical sector.

The WTO Annual Report 2013 provides a brief summary of the organization, an overview of 2012 and a detailed review of the WTO's main areas of activity: trade negotiations; implementation of WTO agreements and trade monitoring; dispute settlement; building trade capacity; and outreach. It also includes a personal message from the Director-General, who reflects on the events of 2012 and the challenges that lie ahead.

The first six chapters of the text examine four broad issues: the role of the Internet in fostering competition, its impact on price dispersion and on business-to-business transactions, and the importance of reputation and trust in the new economy. The last four chapters examine the impact of the Internet on the organization of firms, the efficiency of auctions in the Internet age, how consumers choose websites and acquire product information, and the growing problem of congestion on the Internet.

This book offers an update on recent developments in modern engineering design. Different engineering disciplines, such as mechanical, materials, computer and process engineering, provide the foundation for the design and development of improved structures, materials and processes. The modern design cycle is characterized by the interaction between various disciplines and a strong shift to computer-based approaches where only a few experiments are conducted for verification purposes. A major driver for this development is the increased demand for cost reduction, which is also linked to environmental demands. In the transportation industry (e.g. automotive or aerospace), the demand for higher fuel efficiency is related to reduced operational costs and less environmental damage. One way to fulfil such requirements is lighter structures and/or improved processes for energy conversion. Another emerging area is the interaction of classical engineering with the health and medical sector.

This illustrated handbook will familiarize pilots with physical and psychological factors affecting judgment, responses and attention in flight. Information on causes, symptoms, preventions and remedies for specific conditions such as: motion sickness, fatigue, vision and ear disorders, vertigo, carbon monoxide intoxication, hypoxia and hyperventilation. Chapters on physical examinations, air pressure, alcohol and drug use, noise, age, night flight, cockpit lighting and psychological aspects of flying are included, as well as a discussion of conditions specific to the flying passenger.
