The rapid growth of home health care has raised many unsolved issues and will have consequences that are far too broad for any one group to analyze in their entirety. Yet a major influence on the safety, quality, and effectiveness of home health care will be the set of issues encompassed by the field of human factors research--the discipline of applying what is known about human capabilities and limitations to the design of products, processes, systems, and work environments. To address these challenges, the National Research Council began a multidisciplinary study to examine a diverse range of behavioral and human factors issues resulting from the increasing migration of medical devices, technologies, and care practices into the home. Its goal is to lay the groundwork for a thorough integration of human factors research with the design and implementation of home health care devices, technologies, and practices. On October 1 and 2, 2009, a group of human factors and other experts met to consider a diverse range of behavioral and human factors issues associated with the increasing migration of medical devices, technologies, and care practices into the home. This book is a summary of that workshop, representing the culmination of the first phase of the study.

First published in 2000, this volume explores how Asia has developed very rapidly in the last quarter of the century and will be a main focus of the world in the 21st century. With rapid growth and development, the urban areas in the region are undergoing dramatic changes. An appreciation of the heterogeneous nature of Asian cities and the related planning practices in the first step to understand various urban development problems in the region. This book is a consolidated effort by prominent scholars in Asian planning schools to explore urban development and planning practices in Asia. The book reflects on and examines some of the past and current challenges, and considers future prospects of urban and regional planning, environment, housing, redevelopment and conservation, and planning education in Asia. This book should be useful to students, teachers, researchers, professionals and people who are interested in urban development, planning and environment in Asia.

The United States is among the wealthiest nations in the world, but it is far from the healthiest. Although life expectancy and survival rates in the United States have improved dramatically over the past century, Americans live shorter lives and experience more injuries and illnesses than people in other high-income countries. The U.S. health disadvantage cannot be attributed solely to the adverse health status of racial or ethnic minorities or poor people: even highly advantaged Americans are in worse health than their counterparts in other, "peer" countries. In light of the new and growing evidence about the U.S. health disadvantage, the National Institutes of Health asked the National Research Council (NRC) and the Institute of Medicine (IOM) to convene a panel of experts to study the issue. The Panel on Understanding Cross-National Health Differences Among High-Income Countries examined whether the U.S. health disadvantage exists across the life span, considered potential explanations, and assessed the larger implications of the findings. U.S. Health in International Perspective presents detailed evidence on the issue, explores the possible explanations for the shorter and less healthy lives of Americans than those of people in comparable countries, and recommends actions by both government and nongovernment agencies and organizations to address the U.S. health disadvantage.

As with the first edition, this second edition of Living in a Microbial World is written for students taking a general microbiology course, or a microbiology-based course for non-science majors. The conversational style and use of practical, everyday examples make the essential concepts of microbiology accessible to a wide audience. While using this approach, the text maintains scientific rigor with clear explanations spanning the breadth of microbiology, including health, evolution, ecology, food production, biotechnology, and industrial processes. Each chapter contains a series of case studies based on microbiology in the news, in history, and in literature. There are questions at the end of each case study and the end of each chapter, as well as an online quiz with help on answering the questions. The text, questions, and cases have been updated to reflect the changing influence of microbiology in the world today, from the microbiome, to new disease outbreaks (Ebola and Zika) and antibiotic resistance, to new biotechnology tools (CRISPR-Cas).

Each year, millions of children die of environmental causes and many more suffer serious illness or injury. Children are often the most vulnerable to the condition of their environment -and their health is an index of its quality - but their wellbeing is rarely given priority by governments or aid agencies. Ironically, the problems can be traced back to matters which can be treated straightforwardly and at relatively low cost - poor drinking water or food, or infectious diseases which can be controlled. This book gives a multidisciplinary account of the environmental health hazards threatening children and the range of impacts they can have. It also explains what can be done, by communities as well as governments and aid workers, to provide safe and healthy environments for children. The book looks at conditions in a range of cities in the developing world, as well as pollutants and other health problems affecting children in the North. Published in association with UNICEF, and written by some of the same authors as Environmental Problems in Third World Cities (Earthscan, 1993), this provides excellent course material, and will be useful for practitioners working on child development, infant and maternal health, environmental health and community development. David Satterthwaite is Director of the Human Settlements Programme at the International Institute for Environment and Development, and principal author of Environmental Problems in Third World Cities (1993) and Squatter Citizen(1989).
