This type of 1:7 interface shown in Figure 1 (5-line interface shown) and requiring clock multiplication is widely used for video processing when passing data from one device to another in consumer devices such as televisions and Blu-ray players. One video channel is typically five LVDS data lines and one LVDS clock line.

The LVDS 7:1 transmit module receives seven bits of parallel data and a parallel clock, TX_CLK_in. TX_CLK_in is sent to the fabric CCC block, which generates two output clocks: a parallel clock with the same frequency as TX_CLK_in, and a serial clock with a frequency 3.5x that of TX_CLK_in.

Low-voltage differential signaling, or LVDS, also known as TIA/EIA-644, is a technical standard that specifies electrical characteristics of a differential, serial signaling standard, but it is not a protocol. LVDS operates at low power and can run at very high speeds using inexpensive twisted-pair copper cables. LVDS is a physical layer specification only; many data communication standards ...

2 Low Voltage Differential Signaling 7:1 Low-voltage differential signaling (LVDS) is a high-speed, low-power, general-purpose interface standard. Also known as the ANSI/TIA/EIA-644 standard, LVDS was approved in March 1996. LVDS uses differential signaling with a nominal signal swing of 350 mV differential. The low signal swing
