You can make stock solutions in the chemistry laboratory or buy from chemical manufacturers. Once you have a stock solution, you can prepare solutions of lower concentration by diluting the concentrated stock solution. To dilute means to add a certain amount of solvent(water) to a certain amount of concentrated stock solution.

~~How to prepare a solution from stock solution~~

The typical chemistry stockroom would probably not store solutions of these kinds, so you would need to make them up from the stock thats available. The stockroom probably has pure sodium carbonate, so the 0.500 M Na 2 CO 3 solution can be made from pure Na 2 CO 3 and water.

To make your solution, pour 25 ml of stock solution into a 50 ml volumetric flask. Dilute it with solvent to the 50 ml line. Avoid This Common Dilution Mistake It's a common mistake to add too much solvent when making the dilution.

~~Dilution Calculations From Stock Solutions in Chemistry~~

Using a graduated cylinder (measuring equipment for volumes), measure out the volume of the stock solution and then mix it with the volume of the dilution solution. For example: Measure 22.5 mLs of the stock 5 M solution of NaCl and dilute it with 52.5 mLs of water. Stir to mix.

A solution is a homogeneous mixture created by dissolving one or more solutes in a solvent. The chemical present in a smaller amount, the solute, is soluble in the solvent (the chemical present in a larger amount). Solutions with accurately known concentrations can be referred to as standard (stock) solutions. These solutions are bought directly from the manufacturer or

The calculated volume is equivalent to 67 mL. The final volume of the aqueous solution is to be 500 mL, and 67 mL of this volume comes from the stock solution. The remainder, 500 mL – 67 mL = 433 mL, comes from pure solvent (water, in this case). So to prepare the solution, add 67 mL of 1.5 M stock solution to 433 mL water. Mix and enjoy!

~~How to Calculate Concentrations When Making Dilutions~~ ~~----~~

grams of solute = (wt% solution) x (ml of water) + (100 – wt% solution) As an example, to make 100 ml of 10% NaCl (table salt) solution, use the previous formula to find out how much NaCl you need: grams of NaCl = (10) x (100) + (100 – 10) = 11.1 g; Now you can make your solution: dissolve 11.1 g NaCl in 100 ml of water.

The calculator uses the formula $M_1 V_1 = M_2 V_2$ where "1" represents the concentrated conditions (i.e. stock solution Molarity and volume) and "2" represents the diluted conditions (i.e. desired volume and Molarity). To prepare a solution of specific Molarity based on mass, please use the Mass Molarity Calculator.

In addition, a number of specialized protocols have been included to illustrate the diversity of the techniques available and their widespread applicability. Plant Cell Culture Protocols is aimed at scientists involved in all aspects of plant biotechnological research, as well as those working in other areas of agriculture and horticulture who are interested in expanding their technical repertoire to include in vitro methodology. Its state-of-the-art techniques are certain to make the book today's reference of choice, an indispensable tool in the development of new transgenic plants and full-scale commercial applications.

"It is said if you take care of the pennies, the pounds will take care of themselves. Richard Burton's excellent book takes this approach to calculations applied to the biomedical sciences...This is certainly interesting and engaging but it avoids being complicated." –Journal of Biological Education, April 2009 Biomedical Calculations: Principles and Practice is an accessible, student-friendly introduction to calculating, applying formulae and solving quantitative problems within these subjects. This book targets a problem area for many students and aims to give them the confidence which they are so often lacking when undertaking scientific calculations. It takes a unique approach to the subject and uses unit analysis as a central theme throughout the book to enhance student understanding. Clearly structured throughout, little basic knowledge of mathematics is assumed, but even the most numerate readers will be interested in the sometimes-novel biological detail. Numerous worked examples, supplementary questions and practice problems are provided and although the book is written to be read in sequence, it will also be a useful reference. The central theme of the book focuses on the value of unit analysis in solving quantitative problems, with explanations on how to avoid errors in calculations and in checking, understanding and deriving formulae and equations. As a background to this, there is extensive treatment of physical units, both individually (e.g. kg, m, mmol) and in combination (e.g. m s⁻², mmol L⁻¹), and also of other aspects of quantitative thinking. A variety of topics (mostly from physiology, pharmacology and biochemistry) are used to demonstrate these calculations in practice. Key features: An accessible, student-friendly introduction for all those hesitant in calculating, applying formulae and solving quantitative problems An innovative approach to scientific calculations and how to work with unfamiliar formulae for the biomedical and life sciences Includes modern, up to date definition of pH eliminating the need for logarithms and a discussion of the importance of pH Clear introduction on how to use the book, guidance on units and unit conversion, and an appendix on basic mathematics and notation Use of unit analysis as a central theme Includes numerous worked examples and supplementary questions throughout the text to enhance student understanding
