Amazon.co.uk:Customer reviews: Data Communications and ...

An internetworking device is a widely-used term for any hardware within networks that connect different network resources. Key devices that comprise a network are routers, bridges, repeaters and gateways. All devices have separately installed scope features, per network requirements and scenarios. Techopedia explains Internetworking Device

What is Internetworking Device? - Definition from Techopedia

network devices are ALL devices connected to a network, not just a device that can only talk to its local subnet. internetwork devices are all devices that can communicate with other networks, i.e. when there are other devices (like a router) that give those devices access to a different physical or virtual network.
