Origins of Oxygen - earth's early atmosphere seems to have been mostly nitrogen from volcanic action - oxygen was initially formed by the breakdown of water by UV rays; however much of this reacted with iron, locking it up, while the hydrogen escaped earth - over billions of years, this process cost Mars and Venus their atmospheres - photosynthesis produced oxygen in sufficient

It is much more reactive with common organic molecules than is molecular oxygen per se. In nature, singlet oxygen is commonly formed from water during photosynthesis, using the energy of sunlight. It is also produced in the troposphere by the photolysis of ozone by light of short wavelength and by the immune system as a source of active oxygen.

Oxygen: The Molecule that Made the World, Nick Lane. I ' ve tried twice to read this in full, and found that though at the beginning it ' s engaging and interesting, the sheer level of detail starts to wear on me. This time, I was well served by having the first year of a BSc behind me: it ' s easier to understand what the by-products of photosynthesis are when you have a good grasp of how photosynthesis works, and why it generates highly reactive intermediates.
