Power and volts would drop when letting off the gas especially when coming up to a stop. Assumed it was the alternator since the volts and power would come back up once I would take off or just increase the RPMs. Tested the voltage at the alternator and battery and were at specs. Went ahead and bought new alternator and condition did not change.

Thus, a 5 V regulated power supply starts with a 12 VAC transformer that delivers 12 V to the bridge rectifier, which converts the AC to DC and drops the voltage down to about 9 V and then delivers the voltage to the filter circuit, which smoothes out the ripples and passes the voltage on to the 7805 voltage regulator, which holds the output voltage at 5 V.
