Psychologists throughout the world are being asked to assess an increasingly diverse clientele: immigrants, refugees, second and third generations still influenced by different cultures and languages, and indigenous peoples now moving towards the mainstream. Most are ill-equipped by training and experience to understand, assess, and subsequently treat such clients competently and ethically. Virtually all agree on the need for culture-sensitive assessment, but it has proven difficult to provide adequate services, despite good intentions and funding. Too often, clients who may have different worldview and health-illness beliefs are marginalized. For many reasons, standard assessment instruments designed, researched, and normed on a few groups in the United States—the MMPI-2, the Rorschach, and the TAT—are used as though they were universally applicable. Most busy practitioners have little time to investigate alternatives developed for use with one new group or another, focused on one issue or another, generally in a research context. In this book, Richard Dana proposes a new model of multicultural assessment practice and points directions for future training and research. He presents general, culture-specific, and step-by-step instrument-specific guidelines for the use of the standard amamentarium with different groups. Throughout, he highlights exciting new interpretive possibilities the traditional tests offer that should be regularly exploited, but emphasizes the importance of recognizing psychometric limits. Four extended examples of the use of one or several instruments with a specific group offer concrete illustrations of the model in action. Multicultural Assessment: Principles, Applications, and Examples constitutes an invaluable new resource for psychologists and for their students and trainees.

This latest volume in the series Psychological Assessment – Science and Practice describes the current state-of-the-art in test development and construction. The past 10-20 years have seen substantial advances in the methods used to develop and administer tests. In this volume many of the world's leading authorities collate these advances and provide information about current practices, thus equipping researchers and students to successfully construct new tests using the best modern standards and techniques. The first section explains the benefits of considering the underlying theory when designing tests, such as factor analysis and item response theory. The second section looks at item format and test presentation. The third discusses model testing and selection, while the fourth goes into statistical methods that can find group-specific bias. The final section discusses topics of special relevance such as multi-trait multi-state analyses and development of screening instruments.

This edition examines the philosophical, historical and methodological foundations of psychological testing, assessment and measurement, while helping students appreciate their benefits and pitfalls in practice.
