Using Kenya as a case-study to mirror other African countries this book interrogates the phenomenon of leadership, within and without the political domain.

This book uses John Dewey to articulate discursive practices that would help citizens form better intellectual and moral relationships with a 'liquid' global political environment characterized by flexible accumulation, uneven development, and other phenomenon produced by what Frederic Jameson characterizes increased 'space-time compression.' These practices, derived from Dewey's aesthetic interpretation of thinking and effective classroom practice, form the basis of an 'ethical life' encouraging individuals to build meditative links between their particular interests and their more universal implications.

The central focus of Peirce's work is the development of self-control through engaging in a critical, reflective practice of habit development. This book details that development from a philosophical, pragmatic perspective.

Asks why current practices of technology negatively impact humans and the earth and how we can gain a holistic understanding so technology practices can be changed to support the environment.

This book constitutes the first treatment of C. S. Peirce's unique concept of habit. Habit animated the pragmatists of the 19th and early 20th centuries, who picked up the baton from classical scholars, principally Aristotle. Most prominent among the pragmatists thereafter is Charles Sanders Peirce. In our vernacular, habit connotes a pattern of conduct. Nonetheless, Peirce's concept transcends application to mere regularity or to human conduct; it extends into natural and social phenomena, making cohesive inner and outer worlds. Chapters in this anthology define and amplify Peircean habit: as such, they highlight the dialectic between doubt and belief. Doubt destabilizes habit, leaving open the possibility for new beliefs in the form of habit-change; and without habit-change, the regularity would fall short of habit - conforming to automatic/mechanistic systems. This treatment of habit showcases how, through human agency, innovative regularities of behavior and thought advance the process of making the unconscious conscious. The latter materializes when affordances (invariant habits of physical phenomena) form the basis for modifications in action schemas and modes of reasoning. Further, the book charts how indexical signs in language and action are pivotal in establishing attentional patterns; and how these habits accommodate novel orientations within event templates. It is intended for those interested in Peirce's metaphysical or semiotic, including both senior scholars and students of philosophy and religion, psychology, sociology and anthropology, as well as mathematics, and the natural sciences.

This book gives the reader an understanding of what consciousness is about, and of how to make conscious experiences more pleasant. It expands on a new theory that describes the evolutionary trajectory leading to conscious life forms. In short, the evidence suggests that consciousness first evolved some 300 million years ago as a consequence of the introduction of feelings. Feelings offer a strategy for making behavioural decisions. Besides playing a crucial role in the evolution of the human mind, they are a key factor in regard to mental health and quality of life. Fortunately, the human brain is plastic. By exploiting available options for modulating the mind, it is therefore possible to impact on what sort of experiences the brain serves. More specifically, you can strengthen the capacity for positive feelings and reduce the sway of negative feelings. The text covers biological, neurological, psychological, and philosophical aspects of the mind.
