This third edition of a classic textbook can be used to teach at the senior undergraduate and graduate levels. The material concentrates on fundamental theories as well as techniques and algorithms. The advent of the Internet and the World Wide Web, and, more recently, the emergence of cloud computing and streaming data applications, has forced a renewal of interest in distributed and parallel data management, while, at the same time, requiring a rethinking of some of the traditional techniques. This book covers the breadth and depth of this re-emerging field. The coverage consists of two parts. The first part discusses the fundamental principles of distributed data management and includes distribution design, data integration, distributed query processing and optimization, distributed transaction management, and replication. The second part focuses on more advanced topics and includes discussion of parallel database systems, distributed object management, peer-to-peer data management, web data management, data stream systems, and cloud computing. New in this Edition: • New chapters, covering database replication, database integration, multidatabase query processing, peer-to-peer data management, and web data management. • Coverage of emerging topics such as data streams and cloud computing • Extensive revisions and updates based on years of class testing and feedback Ancillary teaching materials are available.

The Paintings of Hendrick ter Brugghen (1588–1629), is the first major study of this important early seventeenth-century master since Benedict Nicolson's classic monograph of 1958. It comprises two chapters that explore ter Brugghen's development as an artist and the reception of his work among contemporaries, followed by a truly monumental catalogue raisonné of ter Brugghen's 89 authentic paintings, 54 pictures associated with the artist and/or his workshop, 141 rejected works, 42 lost works, and lastly, 10 drawings that have been linked to ter Brugghen directly or related to his paintings. Already celebrated during his lifetime, and avidly collected by elite cognescenti in the Dutch Republic and abroad, ter Brugghen executed a dazzling variety of paintings, ranging from Bible subjects and saints, to fascinating mythological images, as well as scenes of daily life, including musicians. Although his knowledge of paintings by Caravaggio that he had seen during his early sojourn in Rome always remained acute, these experiences were continually tempered by his awareness of older Northern European artistic traditions and conventions, with the result that ter Brugghen created pictures whose subject matter and style are fascinating, and at times, unique. Until his untimely death in August of 2003, Leonard J. Slatkes was Distinguished Professor of Art History at Queens College of the City University of New York, NY. He was an internationally renowned expert on the art of the Dutch Caravaggisti, to whom he had devoted many essays, books, and exhibition catalogues. Slatkes had begun conducting research on ter Brugghen's paintings in the 1960's, with the expectation of eventually publishing a new monograph on the artist. Wayne Franits, a former student of Slatkes's, is currently Professor of Fine Arts at Syracuse University, Syracuse, NY. He has authored numerous publications on seventeenth-century Dutch and Flemish art.

This book focuses on control techniques for LCL-type grid-connected inverters to improve system stability, control performance and suppression ability of grid current harmonics. Combining a detailed theoretical analysis with design examples and experimental validations, the book offers an essential reference guide for graduate students and researchers in power electronics, as well as engineers engaged in developing grid-connected inverters for renewable energy generation systems.
This is the catalog of an exhibition held at the Museum of Modern Art, New York, and a study of Lichtenstein's work from all phases of his career. It covers the work of 25 years, beginning with 1901 when the famous Benday dots first appeared in the pop images derived from advertisements and bubblegum comics to the 1985 sketches and working drawings for the Equitable Center murals. Rose presents a history of the artist's career, analyzes his techniques and workmanship, and also addresses such topics as the relationship between traditional art and mass communications and the role of parody. ISBN 0-87070-416-8: \$37.50 (For use only in the library).
The theory of Laplace transformation is an important part of the mathematical background required for engineers, physicists and mathematicians. Laplace transformation methods provide easy and effective techniques for solving many problems arising in various fields of science and engineering, especially for solving differential equations. What the Laplace transformation does in the field of differential equations, the z-transformation achieves for difference equations. The two theories are parallel and have many analogies. Laplace and z transformations are also referred to as operational calculus, but this notion is also used in a more restricted sense to denote the operational calculus of Mikusinski. This book does not use the operational calculus of Mikusinski, whose approach is based on abstract algebra and is not readily accessible to engineers and scientists. The symbolic computation capability of Mathematica can now be used in favor of the Laplace and z-transformations. The first version of the Mathematica Package LaplaceAndzTransforms developed by the author appeared ten years ago. The Package computes not only Laplace and z-transforms but also includes many routines from various domains of applications. Upon loading the Package, about one hundred and fifty new commands are added to the built-in commands of Mathematica. The code is placed in front of the already built-in code of Laplace and z-transformations of Mathematica so that built-in functions not covered by the Package remain available. The Package substantially enhances the Laplace and z-transformation facilities of Mathematica. The book is mainly designed for readers working in the field of applications.

From Tin Pan Alley to grand opera, player-pianos to phonograph records, David Suisman explores the rise of music as big business and the creation of a radically new musical culture. Provocative, original, and lucidly written, Selling Sounds reveals the commercial architecture of America's musical life.

This report is a demographic study of the United States education system from kindergarten through post-graduate education. Part 1 provides a briefing on the major demographic trends that form the framework of the analysis in terms of: (1) number of births in different groups; (2) rate of age increase in various groups due to varying birth rates; (3) changes in family status; (4) differences in educational needs by region; and (5) education, including educational supply and job demand, and the growing need for day care and early childhood programs such as Head Start. Part 2 concerns the retention of students through the school system to high school graduation. Part 3 concerns the accessibility of college to different socioeconomic groups. Part 4 discusses retention of students through college graduation in the context of the number of years it takes students to reach that goal. Throughout, suggestions are offered on how to deal with the impact of increased minorities in the educational system and how best to structure curricula to better educate the population as a whole. (CG)

This book is unique in that it brings together published viscosity data, experimental methods, theoretical, correlation and predictive procedures in a single volume. The readers will get a better understanding of why various methods are used for measuring viscosity of different types of liquids and why an experimental method is dependent on fluid characteristics, such as Newtonian or non-Newtonian fluids.
