Explore the dynamic interplay between copy and image! This frequently overlooked yet critical element of modern photojournalism is the subject of *Pictures & Words*. This title leads readers on an extraordinary investigation into the use of photos and accompanying captions in seven distinct areas: news, features, illustrations, art, advertising, fashion, and technology/science. The book begins by offering a window into the origin of modern photojournalism from its beginnings in Europe in the 1930s, complete with examples from historical archives that showcase how changes in meaning can result from the way words and photos are combined. Equipped with these lessons, readers delve into the roles of today's photographers, photo editors, copy editors, and reporters by tracing the path of a photograph and its accompanying caption from initial assignment to final appearance in a newspaper. Further insights are gleaned as readers go inside National Geographic, examining the importance of the feature photographs that accompany articles and documentary-style looks at subjects such as poverty, pollution, politics, and more. Here, emphasis is on understanding the interaction of photographer, writer and editor as they decide on captions and/or copy blocks. The final chapter of the book distinguishes between photos and illustrations, with guidelines for using stock photos and solutions for handling copyright problems and permissions. The result is a photojournalism handbook that speaks to both photographer and writer, empowering each with a richer appreciation of how their photographs and words are successfully linked.

Exploring Cognition: Damaged Brains and Neural Networks analyses the contribution made by cognitive neuropsychology and connectionist modelling to theoretical explanations of cognitive processes. Bringing together evidence from both damaged brains and neural networks, this exciting and innovative approach leads to re-evaluation of traditional theories: connectionist models lesioned to mimic the residual function of the damaged brain and rehabilitated to simulate the process of recovery suggest underlying mechanisms and challenge previous interpretations. In this reader key articles by leading international researchers are combined with linking commentaries that provide a context, highlight the conceptual themes and evaluate the evidence. Carefully selected to include hotly debated topics, the papers cover, among others, the controversies surrounding explanations for category specificity in object recognition and for covert recognition of faces and words; the mechanisms underlying the use of regular and irregular past tenses; and the reading of regularly and irregularly spelled words. The challenges posed by connectionist models to assumptions about the nature of dissociations, the need for symbolic rule-based operations in language processing and the modularity and localisation of processes are assessed. *Exploring Cognition: Damaged Brains and Neural Networks* will be of interest to advanced undergraduates, postgraduates and researchers in cognitive neuropsychology and cognitive neuroscience.
