Modern Control Systems, 12e, is ideal for an introductory undergraduate course in control systems for engineering students.

Written to be equally useful for all engineering disciplines, this text is organized around the concept of control systems theory as it has been developed in the frequency and time domains.

It provides coverage of classical control, employing root locus design, frequency and response design using Bode and Nyquist plots. It also covers modern control methods based on state

variable models including
pole placement design
techniques with full-state
feedback controllers and
full-state observers. Many
examples throughout give
students ample opportunity
to apply the theory to the
design and analysis of
control systems.

Incorporates computer-aided
design and analysis using
MATLAB and LabVIEW
MathScript.

"Illustrates the analysis,
behavior, and design of
linear control systems using
classical, modern, and
advanced control techniques.
