You are probably familiar with the three states of matter—solid, liquid, and gas. The Kinetic Molecular Theory of gases (and, therefore, the Ideal Gas Law) states that gases exhibit compressibility and elastic collisions. Compressibility describes the change in volume of the substance when the pressure on that substance changes.

There are three main states of matter: solid, liquid, and gas. Examples of solids include a table, a pencil, and ice. The atoms in a solid are packed tightly together (often in a particular order and pattern) and slowly vibrate. Atoms in a liquid are packed less tightly together and flow around each other.

State of Matter States of matter determined by a balance of forces among the particles. Particle Energies (temperature) causes them to move around and spread apart while the attractive Forces smaller particles cause them to stick together. How these forces balanced out determines the state of matter.

A gas is a state of matter with no defined shape or volume. Gases have their own unique behavior depending on a variety of variables, such as temperature, pressure, and volume. While each gas is different, all gases act in a similar matter. This study guide highlights the concepts and laws dealing with the chemistry of gases.
