Suturing techniques involved in dental surgery

The 3 absorbable suture materials most commonly used in the oral cavity of the dog and cat are poliglecaprone, polyglactin 910 and chromic gut. Monofilament suture (poliglecaprone) Poliglecaprone (e.g. Securocryl™, Monocryl®) is often a preferred suture material for the oral cavity because it has less tissue drag, less tissue reactivity and is rapidly absorbed compared to many other absorbable sutures.

Suture Selection for Wounds in the Oral Cavity

Successful dental suturing ororal surgery is dependent on accurate coaptation of the flaps. Various methods and materials have been used (sutures, stents, paste dressings, tissue tacks and adhesives) for precise flap placement. Suturing has remained the most popular method.

Dental Suturing Materials and Techniques

Technique The procedure is simple and repetitive. A single interrupted suture is used to make the initial tie. The needle is next inserted through the outer surface of the buccal flap and the underlying surface of the lingual flap. The needle is then passed through the remaining loop of the suture, and the suture is pulled tightly, thus locking it. This procedure is continued until the final suture is tied off at the terminal end 146

SUTURES AND SUTURING - SlideShare

Suture area is first cleaned with normal saline. The suture is grasped with non-tooth dissecting forceps and lifted above the epithelial surface. Scissors are then passed through one loop and then transected close to the surface to avoid dragging contaminated suture material through tissues. The suture is then pulled out towards incision line to prevent dehiscence.If suture entrapped in a scab, application of hydrogen peroxide or saline solution is necessary. If pieces of suture left ...
