Logistic regression achieves this by taking the log odds of the event $\ln(P/1-P)$, where, P is the probability of event. So P always lies between 0 and 1. Taking exponent on both sides of the equation gives:

Logistic Organ Dysfunction System Score. The LODS (Logistic Organ Dysfunction System) was developed in 1996 using multiple logistic regression applied to selected variables from a large database of ICU patients. 14 To calculate the score, each organ system receives points according to the worst value for any variable for that system on that day. If no organ dysfunction is present, the score is 0, rising to a maximum of 5.
