$S = -(1)(0.1 \text{ mol/L})(0.0831 \text{ L}\cdot\text{bars/mol}\cdot\text{K})(293 \text{ K}) = -2.43 \text{ bars}$ .  $\Psi = \Psi_P + \Psi_S = 0 \text{ bars} + -2.43 \text{ bars} = -2.43 \text{ bars}$ . The  $\Psi$  of the root tissue is  $-3.3 \text{ bars}$  and the  $\Psi$  of the sucrose solution is  $-2.43 \text{ bars}$ . Water will flow into the root tissue because free water always moves towards the lower overall water potential.

In Figure 2, water will move from a region of higher to lower water potential until equilibrium is reached. Solute potential ( $\Psi_s$ ), pressure potential ( $\Psi_p$ ), and gravity potential ( $\Psi_g$ ) influence total water potential for each side of the tube ( $\Psi_{\text{total right}}$  or  $\Psi_{\text{total left}}$ ), and therefore, the difference between  $\Psi_{\text{total}}$  on each side ( $\Delta\Psi$ ). Matric potential ( $\Psi_m$ ), the potential due to interaction of water with solid substrates, is ignored ...
